Preliminary migrate analysis of M. californianus

MIGRATION RATE AND POPULATION SIZE ESTIMATION

using the coalescent and maximum likelihood or Bayesian inference
Migrate-n version 3.7.2 [April-12-18]
Program started at   Wed Jun 2 13:54:44 2021
Program finished at   Wed Jun 2 20:33:10 2021

Options

Datatype:	DNA sequence data

Inheritance scalers in use for Thetas:
All loci use an inheritance scaler of 1.0
[The locus with a scaler of 1.0 used as reference]

Random number seed:	(with internal timer)	1043307200

Start parameters:

Theta values were generated   from guessed values
   Theta = 0.01000
M values were generated   from guessed values
   M-matrix:
   100000.00 [all are the same]
Connection type matrix:
  where m = average (average over a group of Thetas or M,
  s = symmetric M, S = symmetric 4Nm, 0 = zero, and not estimated,
  * = free to vary, Thetas are on diagonal

Mutation rate among loci: Mutation rate is constant

Analysis strategy: Bayesian inference

Proposal distributions for parameter

Parameter	Proposal
Theta	Metropolis sampling
M	Slice sampling

Prior distribution for parameter

Parameter	Prior	Minimum	Mean*	Maximum	Delta	Bins
Theta	Exp window	0.000010	0.010000	10.000000	1.000000	500
M	Exp window	0.000100	100000.000000	1000000.000000	100000.000000	500

Markov chain settings: Long chain
Number of chains   1
   Recorded steps [a]   1000
   Increment (record every x step [b]   100
   Number of concurrent chains (replicates) [c]   3
   Visited (sampled) parameter values [a*b*c]   300000
   Number of discard trees per chain (burn-in)   1000

Multiple Markov chains:
   Static heating scheme   4 chains with temperatures

100000.00	3.00	1.50	1.00

Swapping interval is 1

Print options:
   Data file: ../../mcalifornianus_210528.mig
   Output file: outfile.txt
   Posterior distribution raw histogram file: bayesfile
   Print data: No
   Print genealogies [only some for some data type]:   None

Data summary

Datatype: Sequence data

Number of loci: 1

Population	Locus	Gene copies

Bayesian Analysis: Posterior distribution over all loci
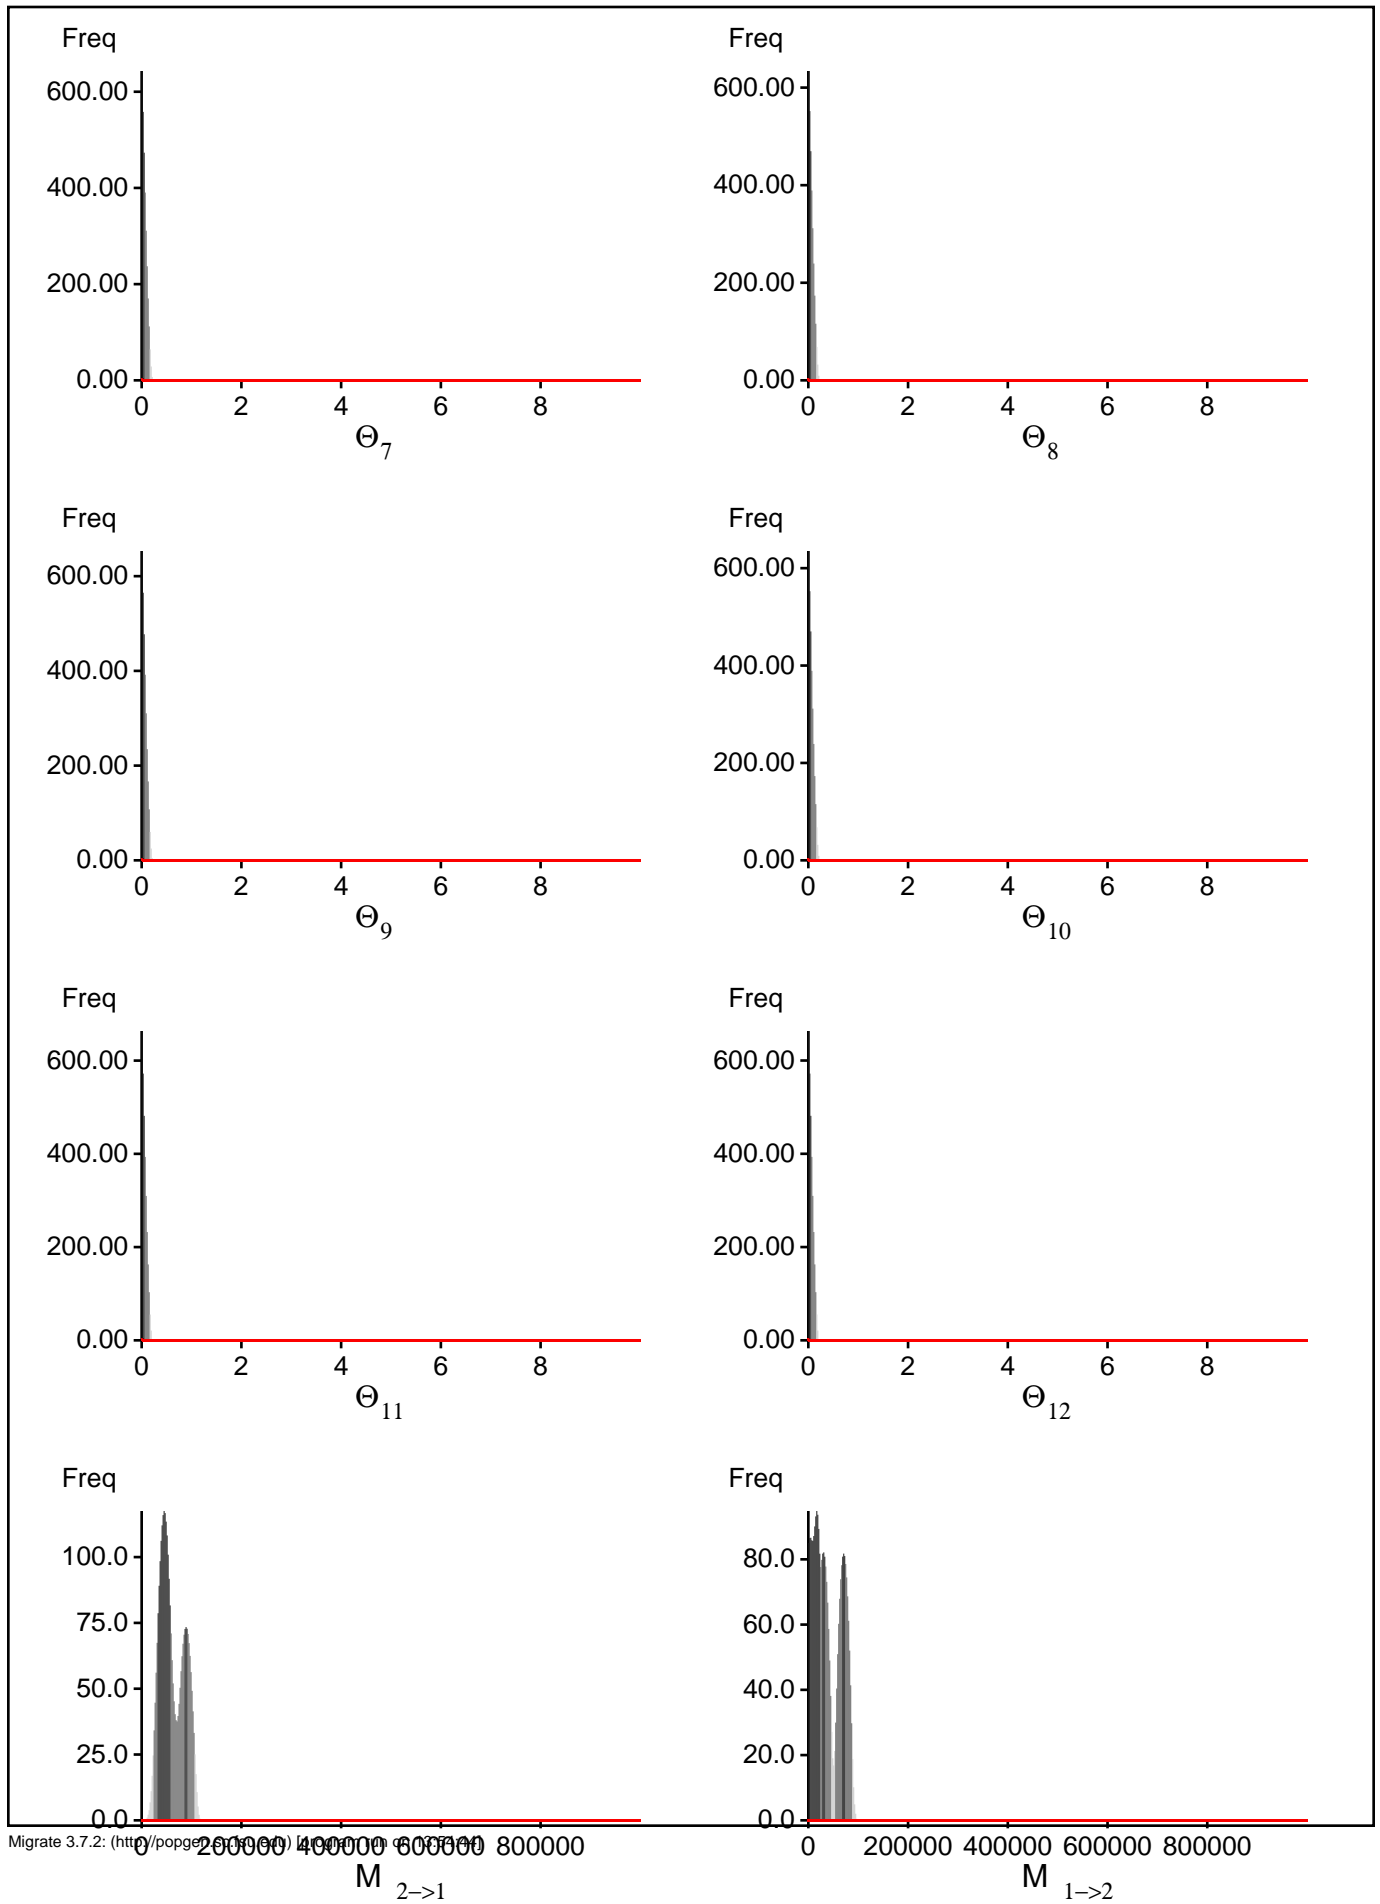

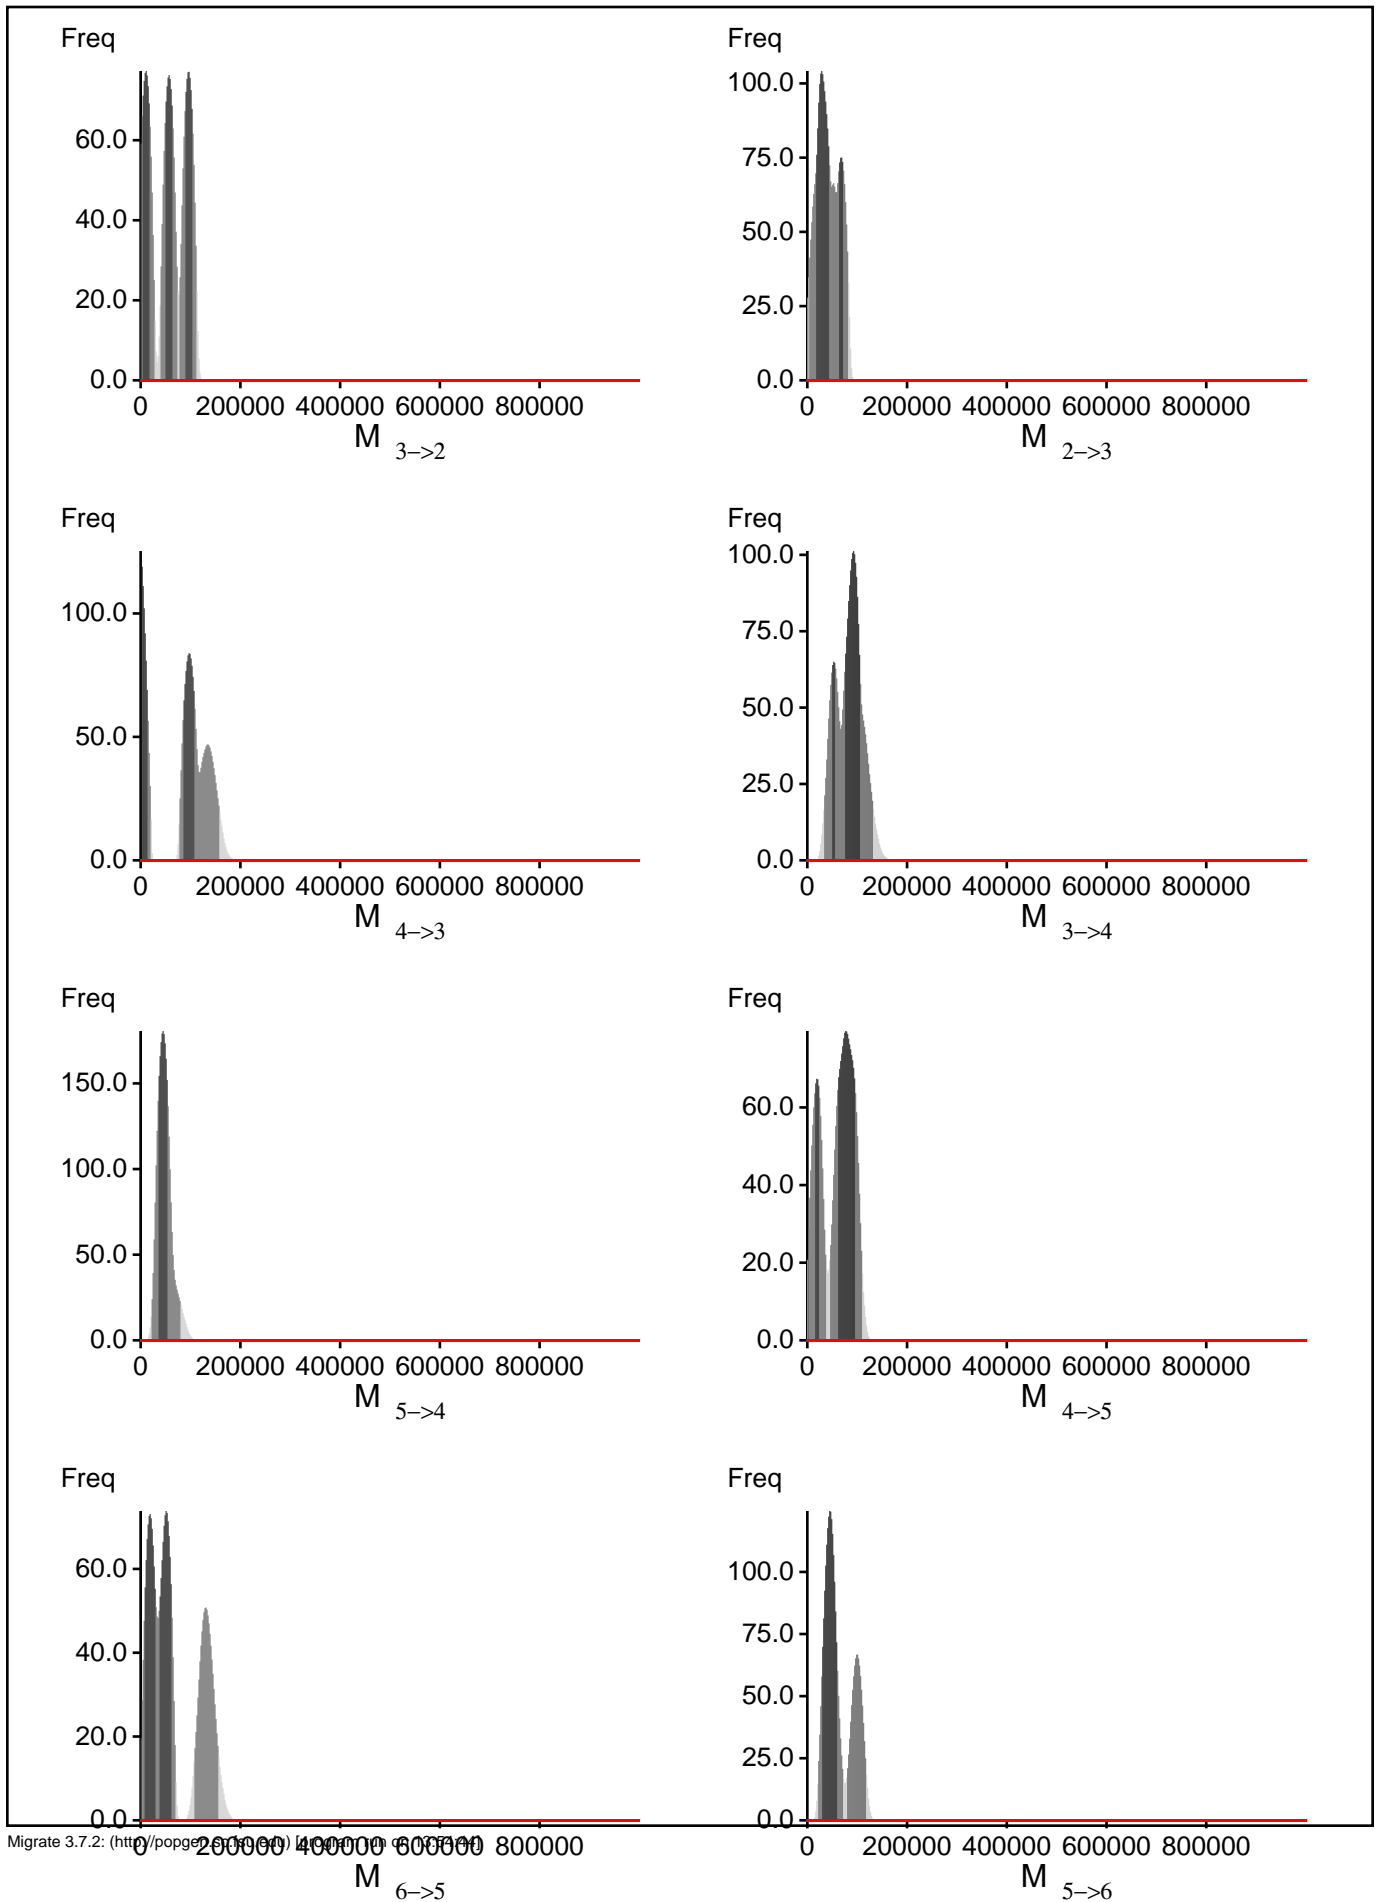

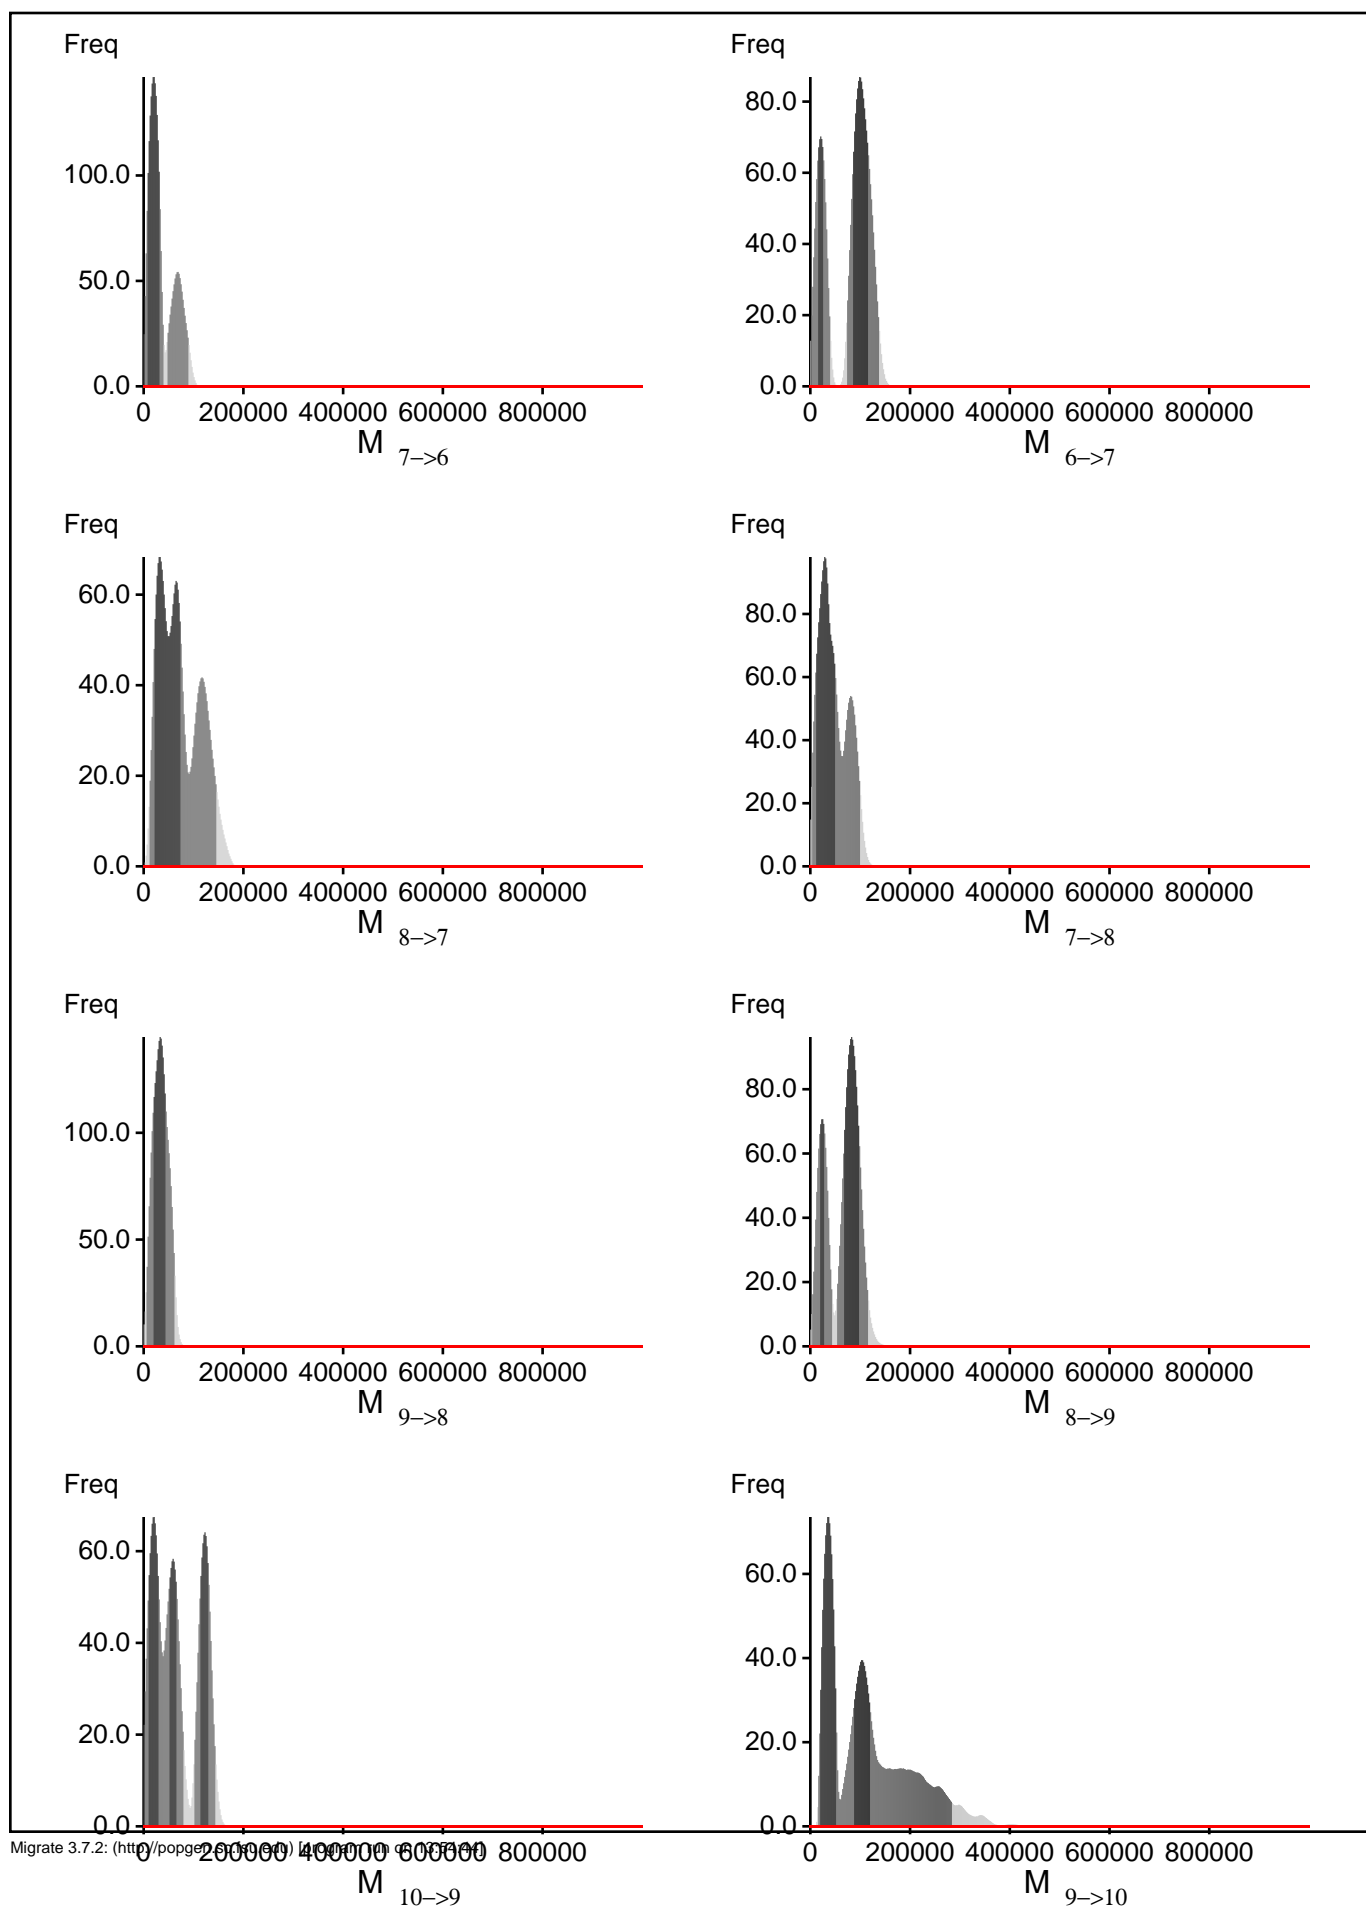

Log-Probability of the data given the model (marginal likelihood)

Use this value for Bayes factor calculations:

BF = Exp[ln(Prob(D | thisModel) - ln(Prob(D | otherModel)

or as LBF = 2 (ln(Prob(D | thisModel) - ln(Prob(D | otherModel))

shows the support for thisModel]

Method	ln(Prob(D|Model))	Notes
Thermodynamic integration	-2218.400970	(1a)
	-2137.755114	(1b)
Harmonic mean	-1858.264490	(2)

(1a, 1b and 2) are approximations to the marginal likelihood, make sure that the program run long enough!

(1a, 1b) and (2) should give similar results, in principle.

But (2) is overestimating the likelihood, it is presented for historical reasons and should not be used

(1a, 1b) needs heating with chains that span a temperature range of 1.0 to at least 100,000.

(1b) is using a Bezier-curve to get better approximations for runs with low number of heated chains

Potential Problems

This section reports potential problems with your run, but such reporting is often not very accurate. Whith many parameters in a multilocus analysis, it is very common that some parameters for some loci will not be very informative, triggering suggestions (for example to increase the prior range) that are not sensible. This suggestion tool will improve with time, therefore do not blindly follow its suggestions. If some parameters are flagged, inspect the tables carefully and judge wether an action is required. For example, if you run a Bayesian inference with sequence data, for macroscopic species there is rarely the need to increase the prior for Theta beyond 0.1; but if you use microsatellites it is rather common that your prior distribution for Theta should have a range from 0.0 to 100 or more. With many populations (>3) it is also very common that some migration routes are estimated poorly because the data contains little or no information for that route. Increasing the range will not help in such situations, reducing number of parameters may help in such situations.

No warning was recorded during the run
